

## Results

After only 28 days of application, Juventide™ induced a significant ( $p < 0.01$ ) average reduction in wrinkle depth and volume of 18% and 21% respectively. This reduction was also significant ( $p < 0.05$ ) when compared to placebo with respectively 12% and 15% reductions. Wrinkle width has been reduced by 4% but the result was not significant (D28/D0  $p = 0.26$ ; Juventide™/Placebo  $p = 0.35$ ).

## Conclusion

A cream containing 1.6% Juventide™ significantly improved wrinkle appearance after 28 days compared to placebo and demonstrated an excellent tolerability.

Juventide™ provides a significant and sustained reduction in the appearance of wrinkles on mature skin for a maximal youthful look.
